

A ATE at high output coverage (n = 612)

B Coverage against ATE (n = 861)

- | | | |
|---|--|---|
| — all systems | ---□--- OKVIS2 (189 at high coverage) | ---△--- DM-VIO (41 at high coverage) |
| --○-- Basalt (196 at high coverage) | ---◆--- ORB-SLAM3 (186 at high coverage) | ---▼--- Snake-SLAM (0 at high coverage) |

Panel B plots every evaluable record against $\min(C, S)$; coverage improves to the left, while ATE spans several orders of magnitude.

Exact coverage cannot be placed on a logarithmic axis and is drawn in the separate band at the far left. 612 records meet the 0.99 threshold and 66 of those exceed 1 m. 7 records above 10^4 m lie outside the drawn range and are retained in every estimate.
